## fontspec.dtx

### 1 Package declaration

List all dtx files for running the ins file and typesetting the code.

```
1  {*dtx}
2  \gdef\FONTSPECDTX{
3    \DTX{fontspec.dtx}
4    \DTX{fontspec-code-load.dtx}
5    \DTX{fontspec-code-vars.dtx}

22   \DTX{fontspec-code-closing.dtx}
23   \DTX{fontspec-code-xfss.dtx}
24 }
25 </dtx>
```

Now exit if we're using plain TeX; this would usually be the case when loading this file with `fontspec.ins`.

```
26 {*dtx}
27 \def\tmpa{plain}
28 \ifx\tmpa\fmtname\expandafter\endinput\fi
29 </dtx>
```

Metadata for documentation; the official title and authors of the package.

```
30 {*dtx}
31 \title{

40 }
41 </dtx>
```

Declare the package version and date for each of the .sty files generated. In addition, declare the version and date for this .dtx file.

```
42 <fontspec>\RequirePackage{xparse}
43 <fontspec & load>\ProvidesExplPackage{fontspec}%
44 <fontspec & XE>\ProvidesExplPackage{fontspec-xetex}%
45 <fontspec & LU>\ProvidesExplPackage{fontspec-luatex}%

48 \ProvidesExplFile{fontspec.dtx}
49 </dtx>
50 <*fontspec>
51 {2024/05/11}{2.9e}{Font selection for XeLaTeX and LuaLaTeX}
52 </fontspec>
```

Here the version and date are setup for typesetting the documentation.

```
53 <*dtx>
54 \GetFileInfo{fontspec.dtx}

## fontspec-code-load.dtx

### 1 The `fontspec.sty` loading file

Before we begin, for the rest of the package we use the `\Expl3` module syntax with module name ‘`fontspec`’.

```
1 <@@=fontspec>
```

The `fontspec.sty` file is simply set up to load the appropriate `fontspec-xetex.sty` or `fontspec-luatex.sty` file. This is performed by the following code.

```
2 <*load>
```

#### Lua<sup>AT</sup>E<sub>X</sub>

```
3 \sys_if_engine_luatex:T
4 {
5   \RequirePackage{luatofloat}
6   \lua_now:e{require("fontspec")}
7   \RequirePackage{fontspec-luatex}
8   \endinput
9 }
```

#### X<sup>ET</sup>A<sub>E</sub>X

```
10 \sys_if_engine_xetex:T
11 {
12   \RequirePackage{fontspec-xetex}
13   \endinput
14 }
```

**Other** If not one of the above, error and exit.

```
15 \msg_new:nnn {fontspec} {cannot-use-pdftex}
16 {
17   The~ fontspec~ package~ requires~ either~ XeTeX~ or~ LuaTeX.\\\\\
18   You~ must~ change~ your~ typesetting~ engine~ to,~ e.g.,~
19   "xelatex"~ or~ "lualatex"~ instead~ of~ "latex"~ or~ "pdflatex".
20 }
21 \msg_fatal:nn {fontspec} {cannot-use-pdftex}
```

**Closing** That’s the end of the `fontspec.sty` file.

```
22 \endinput
23 </load>
```

## fontspec-code-vars.dtx

### 1 Declaration of variables

This file consists solely of declaration of variables used by fontspec. In some cases these variables are also initialised with default values. In time I would like to move these initialisations

#### Booleans

\l\_@@\_firstime\_bool As \keys\_set:nn is run multiple times, some of its information storing only occurs once while we decide if the font family has been defined or not. When the later processing is occurring per-shape this no longer needs to happen; this is indicated by the 'firstime' conditional.

1 \bool\_new:N \l\_@@\_firstime\_bool

(End of definition for \l\_@@\_firstime\_bool. This function is documented on page ??.)

2 \bool\_new:N \l\_@@\_nobf\_bool  
3 \bool\_new:N \l\_@@\_noit\_bool  
4 \bool\_new:N \l\_@@\_nosc\_bool  
5 \bool\_new:N \l\_@@\_check\_bool  
6 \bool\_new:N \l\_@@\_tfm\_bool  
7 \bool\_new:N \l\_@@\_atsui\_bool  
8 \bool\_new:N \l\_@@\_ot\_bool  
9 \bool\_new:N \l\_@@\_mm\_bool  
10 \bool\_new:N \l\_@@\_harfbuzz\_bool  
11 \bool\_new:N \l\_@@\_graphite\_bool  
12 \bool\_new:N \l\_@@\_fontcfg\_bool  
13 \bool\_set\_true:N \l\_@@\_fontcfg\_bool

For dealing with legacy maths:

14 \bool\_new:N \g\_@@\_math\_euler\_bool  
15 \bool\_new:N \g\_@@\_math\_lucida\_bool  
16 \bool\_new:N \g\_@@\_pkg\_euler\_loaded\_bool

For package options:

17 </fontspec>  
18 {\*options}  
19 \bool\_new:N \g\_@@\_cfg\_bool  
20 \bool\_new:N \g\_@@\_math\_bool  
21 </options>  
22 {\*fontspec}  
23 \bool\_new:N \l\_@@\_tmpa\_bool  
24 \bool\_new:N \l\_@@\_disable\_defaults\_bool  
25 \bool\_new:N \l\_@@\_alias\_bool  
26 \bool\_new:N \l\_@@\_external\_bool  
27 \bool\_new:N \l\_@@\_defining\_encoding\_bool  
28 \bool\_new:N \l\_@@\_scriptlang\_exist\_bool  
29 \bool\_new:N \g\_@@\_em\_normalise\_slant\_bool  
30 \bool\_new:N \l\_@@\_external\_kpse\_bool

\l\_@@\_never\_check\_bool It is used to disable checking opentype script, language, and tags when running checking code that has a user-defined return path we want to allow the higher-level code to dictate the logic.  
TODO: tidy this up!

31 \bool\_new:N \l\_@@\_never\_check\_bool

(End of definition for \l\_@@\_never\_check\_bool. This function is documented on page ??.)

36 \SetKeys{config,math}
37 \ProcessKeyOptions
```

#### 1.2 Encodings

Now the default, with a just-in-case check:

```
38 \cs_if_exist:cF {T@TU}
```

```

39  {
40    \@@_warning:n {tu-clash}
41    \DeclareFontEncoding{TU}{}{}
42    \DeclareFontSubstitution{TU}{lmr}{m}{n}
43  }
44 \tl_gset:Nn \g_fontsencoding_tl { TU }
45 \tl_set:Nn \rmdefault {lmr}
46 \tl_set:Nn \sfdefault {lmss}
47 \tl_set:Nn \ttdefault {lmtt}
48 \RequirePackage[\g_fontsencoding_tl]{fontenc}
49 \tl_set_eq:NN \UTFencname \g_fontsencoding_tl % for xunicode if needed

```

To overcome the encoding changing the current font size, but only if a class has been loaded first:

```
50 \tl_if_in:NnT \filelist { .cls } { \normalsize }
```

Dealing with a couple of the problems introduced by babel:

```

51 \tl_set_eq:NN \cyrillicencoding \g_fontsencoding_tl
52 \tl_set_eq:NN \latinencoding \g_fontsencoding_tl
53 \AtBeginDocument
54 {
55   \tl_set_eq:NN \cyrillicencoding \g_fontsencoding_tl
56   \tl_set_eq:NN \latinencoding \g_fontsencoding_tl
57 }

```

That latin encoding definition is repeated to suppress font warnings. Something to do with `\select@language` ending up in the `.aux` file which is read at the beginning of the document.

### 1.3 Generic functions

`\FontspecSetCheckBoolTrue` These strange set functions are to simplify returning code from LuaTeX:

### 1 User command internals

#### 1.1 Font selection

\@@\_main\_fontspec:nn This is the main command of the package that selects fonts with various features. It takes two arguments: the font name and the optional requested features of that font.

```
1 \cs_new:Nn \@@_main_fontspec:nn
2 {
3     \fontspec_set_family:Nnn \f@family {#1} {#2}
4     \fontencoding {\g_@@_nfss_enc_tl }
5     \selectfont
6 }
```

(End of definition for \@@\_main\_fontspec:nn. This function is documented on page ??.)

\rmfamily Add an encoding switch to the three family commands.

```
7 \cs_if_exist:NTF \rmfamilyhook
8 {
9     \tl_put_right:Nn \rmfamilyhook {\fontencoding \l_@@_rmfamily_encoding_tl}
10    \tl_put_right:Nn \sffamilyhook {\fontencoding \l_@@_sffamily_encoding_tl}
11    \tl_put_right:Nn \ttfamilyhook {\fontencoding \l_@@_ttfamily_encoding_tl}

13 {

\setmainfont The following three macros perform equivalent operations setting the default font for a particular family: ‘roman’, sans serif, or typewriter (monospaced).

They end with \normalfont so that if they’re used in the document, the change registers immediately.

\setmathrm These commands are analogous to \setmainfont and others, but for selecting the font used for \mathrm, etc. They can only be used in the preamble of the document. \setboldmathrm is used for specifying which fonts should be used in \boldmath.

96 \onlypreamble\setboldmathrm
97 \onlypreamble\setmathsf

\@@\_main\_newfontfamily:NnnN The inner fontspec workings define a font family, which is then used in a typical NFSS \fontfamily declaration, saved in the macro name specified. The fourth argument determines which xpparse function to set the macro with (new/renew/etc).

(End of definition for `\@@_set_font_default_features:nnn`. This function is documented on page ??.)

`\addfontfeatures` In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level `\fontspec` command.

The default options are *not* applied (which is why `\g_fontspec_default_fontopts_t1` is emptied inside the group; this is allowed as `\l_fontspec_family_tl` is globally defined in `\@@_select_font_family:nn`), so this means that the only added features to the font are strictly those specified by this command.

`\addfontfeature` is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

### 1.3 Defining new font features

- `\newfontfeature` `\newfontfeature` takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature.

```

171 \cs_new:Nn \@@_main_newfontfeature:nn

```

(End of definition for `\newfontfeature`. This function is documented on page ??.)

- `\newAATfeature` This command assigns a new AAT feature by its code (#2,#3) to a new name (#1). Better than `\newfontfeature` because it checks if the feature exists in the font it's being used for.

```

178 \cs_new:Nn \@@_main_newAATfeature:nnnn

- `\newopentypefeature` This command assigns a new OpenType feature by its abbreviation (#2) to a new name (#1). Better than `\newfontfeature` because it checks if the feature exists in the font it's being used for.

## fontspec-code-api.dtx

### 1 Programmer's interface

These functions are not used directly by fontspec when defining fonts; they are designed to be used by other packages who wish to do font-related things on top of fontspec itself.

Because I haven't fully explored how these functions will behave in practise, I am not giving them user-level names. As it becomes more clear which of these should be accessible by document writers, I'll open them up a little more.

All functions are defined assuming that the font to be queried is currently selected as a fontspec font. (I.e., via `\fontspec` or from a `\newfontfamily` macro or from `\setmainfont` and so on.)

### 2 Overview

#### 2.1 Commands

---

```
\fontspec_gset_family:Nnn \fontspec_set_family:Nnn <family> {<features>} {<font name>}
```

`\fontspec_set_family:Nnn` Defines a new NFSS font family from given `<features>` and `<font>`, and stores the name in the token list variable `<family>`. See the standard fontspec user commands for applications of this function.

---

```
\fontspec_gset_fontface:NNnn \fontspec_set_fontface:NNnn <face> <family> {<features>} {<font name>}
```

---

```
\fontspec_set_fontface:NNnn
```

As for `\fontspec_set_family:Nnn` but with a single font face only. (E.g., no bold, italic shapes, etc.) The control sequence `<face>` is a primitive TeX font command.

#### 2.2 Conditionals

---

```
\fontspec_font_if_exist:nTF \fontspec_font_if_exist:nTF {<font name>} Argtrue code {<false code>}
```

Does this font exist? The font name can refer to the 'logical' name or to a filename with known font extension.

---

```
\fontspec_if_fontspec_font:TF \fontspec_if_fontspec_font:TF {<true code>} {<false code>}
```

---

```
\fontspec_if_aat_feature:nnTF \fontspec_if_aat_feature:nnTF {<true code>} {<false code>}
```

---

```
\fontspec_if_opentype:TF \fontspec_if_opentype:TF {<true code>} {<false code>}
```

---

`\fontspec_if_feature:nTF \fontspec_if_feature:nTF {\feat tag} {\true code} {\false code}`

Check if the raw OpenType `\feat tag` is available in the current font with script and language settings as set up when the font was loaded.

---

`\fontspec_if_feature:nnnTF \fontspec_if_feature:nnnTF {\script tag} {\lang tag} {\feat tag} {\true code} {\false code}`

`\fontspec_if_feature:nTF {\latn} {\ROM} {\pnum} {\True} {\False}`

Test whether the currently selected font with raw OpenType `\script tag` and raw OpenType `\language tag` contains the raw OpenType `\feat tag`. Returns false if the font is not loaded by fontspec or is not an OpenType font.

---

`\fontspec_if_script:nTF \fontspec_if_script:nTF {\script tag} {\true code} {\false code}`  
`\fontspec_if_script:nTF {\latn} {\True} {\False}`

Test whether the currently selected font contains the raw OpenType `\script tag`.

Returns false if the font is not loaded by fontspec or is not an OpenType font.

---

`\fontspec_if_language:nTF \fontspec_if_language:nTF {\lang tag} {\true code} {\false code}`  
`\fontspec_if_language:nTF {\ROM} {\True} {\False}`

Check if the raw OpenType `\language tag` is available in the current font with script settings as set up when the font was loaded.

---

`\fontspec_if_language:nnTF \fontspec_if_language:nnTF {\script tag} {\lang tag} {\true code} {\false code}`  
`\fontspec_if_language:nnTF {\cyrl} {\SRB} {\True} {\False}`

Test whether the currently selected font contains the raw OpenType `\language tag` in `\script tag`.

Returns false if the font is not loaded by fontspec or is not an OpenType font.

---

`\fontspec_if_current_script:nTF \fontspec_if_current_script:nTF {\script tag} {\true code} {\false code}`

Test whether the currently loaded font has been loaded with the specified raw OpenType `\script tag`.

---

`\fontspec_if_current_language:nTF \fontspec_if_current_language:nTF {\lang tag} {\true code} {\false code}`

Test whether the currently loaded font has been loaded with the specified raw OpenType `\language tag`.

---

`\fontspec_if_current_feature:nTF \fontspec_if_current_feature:nTF {\feat tag} {\true code} {\false code}`

Test whether the currently loaded font is using the specified raw OpenType `\feat tag`.

---

`\fontspec_if_small_caps:TF \fontspec_if_small_caps:TF {\true code} {\false code}`

Test whether the current font has small caps available.

### 3 Implementation

\fontspec\_if\_fontspec\_font:*TF*

```
1 \prg_new_conditional:Nnn \fontspec_if_fontspec_font: {TF,T,F}
2 {
3     \cs_if_exist:cTF {g_@@_fontinfo_ \f@family _prop} \prg_return_true: \prg_return_false:
4 }
```

(End of definition for \fontspec\_if\_fontspec\_font:*TF*. This function is documented on page 36.)

\fontspec\_if\_aat\_feature:nn*TF*

Conditional to test if the currently selected font contains the AAT feature (#1,#2).

```
5 \prg_new_conditional:Nnn \fontspec_if_aat_feature:nn {TF,T,F}
6 {
7     \fontspec_if_fontspec_font:TF
8     {

21    }
22}
```

(End of definition for \fontspec\_if\_aat\_feature:nn*TF*. This function is documented on page 36.)

\fontspec\_if\_opentype:*TF*

Test whether the currently selected font is an OpenType font. Always true for LuaTeX fonts.

```
23 \prg_new_conditional:Nnn \fontspec_if_opentype: {TF,T,F}
24 {
25     \fontspec_if_fontspec_font:TF

32     }
33 }
```

(End of definition for \fontspec\_if\_opentype:*TF*. This function is documented on page 36.)

\fontspec\_if\_feature:n*TF*

Test whether the currently selected font contains the raw OpenType feature #1. E.g.: \fontspec\_if\_feature:*n*

Returns false if the font is not loaded by fontspec or is not an OpenType font.

```
34 \prg_new_conditional:Nnn \fontspec_if_feature:n {TF,T,F}
35 {
36     \fontspec_if_fontspec_font:TF

## fontspec-code-internal.dtx

### 1 Internals

#### 1.1 The main function for setting fonts

\@@\_select\_font\_family:nn This is the command that defines font families for use, the underlying procedure of all \fontspec-like commands. Given a list of font features (#1) for a requested font (#2), it will define an NFSS family for that font and put the family name (globally) into \l\_fontsname\_t1. The TeX '\font' command is (globally) stored in \l\_fontsname\_font.

This macro does its processing inside a group to attempt to restrict the scope of its internal processing. This works to some degree to insulate the internal commands from having to be manually cleared.

Some often-used variables to know about:

- \l\_fontsname\_fontname\_t1 is used as the generic name of the font being defined.
- \l\_@@\_fontid\_t1 is the unique identifier of the font with all its features.
- \l\_@@\_fontname\_up\_t1 is the font specifically to be used as the upright font.
- \l\_@@\_basename\_t1 is the (immutable) original argument used for \*-replacing.
- \l\_fontsname\_font is the plain TeX font of the upright font requested.

## 1.2 Setting font shapes in a family

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if `\bfdefault` is redefined to `b`, all bold shapes defined by this package will also be assigned to `b`.

The combination shapes are searched first because they use information that may be redefined in the single cases. E.g., if no bold font is specified then `set_autofont` will attempt to set it. This has subtle/small ramifications on the logic of choosing the bold italic font.

`\@@_find_autofonts:`

### 1.2.1 Fonts

`\@@_set_font_type:N` Now check if the font is to be rendered with ATSUI or Harfbuzz. This will either be automatic (based on the font type), or specified by the user via a font feature.

This macro sets booleans accordingly depending if the font in `\l_fonts_spec_test_font` is an AAT font or an OpenType font or a font with feature axes (either AAT or Multiple Master), respectively.

```

375 \cs_new:Nn \@@_set_font_type:N

404     
```

If automatic, the `\l_@@_renderer_t1` token list will still be empty (other suffices that could be added will be later in the feature processing), and if it is indeed still empty, assign it a value so that the other weights of the font are specifically loaded with the same renderer.

LuaTeX only supports one:

```
405  {*LU}
406      \bool_set_true:N \l_@@_ot_bool
407  (/LU)
408 }
```

```
\@@_set_autofont:Nnn #1 : Font name tl
#2 : Base font name
#3 : Font name modifier
```

This function looks for font with `\langle name \rangle` and `\langle modifier \rangle` #2#3, and if found (i.e., different to font with name #2) stores it in `tl #1`. A modifier is something like `/B` to look for a bold font, for example.

We can't match external fonts in this way (in X<sub>E</sub>T<sub>E</sub>X anyway; todo: test with LuaTeX). If `\langle font name t1 \rangle` is not empty, then it's already been specified by the user so abort. If `\langle Base font name \rangle` is not given, we also abort for obvious reasons.

If `\langle font name t1 \rangle` is empty, then proceed. If not found, `\langle font name t1 \rangle` remains empty. Otherwise, we have a match.

This extra stuff for the slanted shape substitution is a little bit awkward. We define the slanted shape to be a synonym for it when (a) we're defining an italic font, but also (b) when the default slanted shape isn't 'it'. (Presumably this turned up once in a test and I realised it caused problems. I doubt this would happen much.)

We should test when a slanted font has been specified and not run this code if so, but the \@@\_set\_slanted: code will overwrite this anyway if necessary.

This macro takes a four character string and converts it to the numerical representation required for X<sub>E</sub>T<sub>E</sub>X OpenType script/language/feature purposes. The output is stored in #1.

This code is not used in LuaT<sub>E</sub>X, as the checking for that engine is done via Lua code provided by luatofloat.

```

792 <*XE>
 793 \cs_new:Nn \@@_iv_str_to_num:Nn

 797 }
 798 \cs_generate_variant:Nn \@@_iv_str_to_num:Nn {Nx}

```

The input can be of the form of any of these: 'abcd', 'abc', 'abc ', 'ab', 'ab ', etc. (It is assumed the first two chars are *always* not spaces.) So this macro reads in the string padded with \empty s, and anything beyond four chars is snipped. The \empty s then are used to reconstruct the spaces in the string to number calculation.

For backwards compatibility this code also strips a leading + or -.

```

799 \cs_set:Npn \@@_strip_leading_sign:Nw #1#2#3 \q_nil
800 {
801     \bool_if:nTF { \str_if_eq_p:nn {#2} {+} || \str_if_eq_p:nn {#2} {-} }
802     { \@@_iv_str_to_num:w #1 \q_nil #3 \c_empty_tl \c_empty_tl \q_nil }

```

```
803     { \@@_iv_str_to_num:w #1 \q_nil #2#3 \c_empty_tl \c_empty_tl \q_nil }
804 }
```

If input string (after sign is stripped) is more than 4 chars, #6 will contain '*excess*\c\_empty\_tl\c\_empty\_tl'. Therefore use #6 to verify string length.

```
805 \cs_set:Npn \@@_iv_str_to_num:w #1 \q_nil #2#3#4#5#6 \q_nil

## 1.1 Adding features when loading fonts

When remove clashing features,

1. remove the feature being added (to avoid duplicates);
2. remove the inverse of the feature (to avoid cancellation);
3. finally remove all clashing features.

\@@\_make\_AAT\_feature\_string:NnnTF

This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in [...], but also used to check if small caps exists in the requested font (see page 61).

For exclusive selectors, it's easy; just grab the string: For *non-exclusive* selectors, it's a little more complex. If the selector is even, it corresponds to switching the feature on. If the selector is *odd*, it corresponds to switching the feature off. But X<sub>E</sub>T<sub>E</sub>X doesn't return a selector string for this number, since the feature is defined for the 'switching on' value. So we need to

check the selector of the previous number, and then prefix the feature string with ! to denote the switch.

Finally, save out the complete feature string in \l\_fontsfeature\_string\_tl.

## fontspec-code-keyval.dtx

### 1 Font loading (keyval) definitions

This package uses a large number of keyval modules which operate sequentially on keyval input to ensure priority.

```
1 \clist_gset:Nn \g_@@_all_keyval_modules_clist
2 {
3     fontspec, fontspec-opentype, fontspec-aat,
4     fontspec-preparse, fontspec-preparse-cfg, fontspec-preparse-external, fontspec-preparse-ne
5     fontspec-renderer
6 }
```

Wrapper function to save some characters in the source:

```
7 \cs_new:Nn \@@_keys_define_code:nnn
8 {
9     \keys_define:nn {#1} { #2 .code:n = {#3} }
10 }
```

For catching features that cannot be used in \addfontfeatures:

```

## 1.4 General font-independent features

These features can be applied to any font.

**NFSS encoding** For the very brave.

```
287 \@@_keys_define_code:nnn {fontspec-preparse} {NFSEncoding}
288 {
289     \tl_gset:Nx \g_@@_nfss_enc_tl { #1 }
290 }
```

**NFSS family** Interactions with other packages will sometimes require setting the NFSS family explicitly. (By default fontspec auto-generates one based on the font name.)

```
291 \@@_keys_define_code:nnn {fontspec-preparse} {NFSSFamily}
292 {
293     \tl_set:Nx \l_@@_nfss_fam_tl { #1 }
294 }
```

**NFSS series/shape** This option looks similar in name but has a very different function.

```
295 \@@_keys_define_code:nnn {fontspec-preparse} {FontFace}
296 {
297     \tl_clear:N \l_@@_this_font_tl
298     \clist_set:No \l_@@_arg_clist { \use_iii:nnn #1 }

312     { \use_i:nnn #1 } { \use_ii:nnn #1 } { \l_@@_this_font_tl } { \l_@@_this_feat_clist }
313 }
```

**Scale** If the input isn't one of the pre-defined string options, then it's gotta be numerical. \fontspec\_calc\_scale:n and \fontspec\_calc\_scale:nn do all the work in the auto-scaling cases.

```
314 \@@_keys_define_code:nnn {fontspec} {Scale}

```

\@@\_calc\_scale:n This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X<sub>E</sub>T<sub>X</sub>).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

To begin, change to \rmfamily but use internal commands in case csrmfamily has been overwritten. (Note that changing \rmfamily with fontspec resets \encodingdefault appropriately.)

`\@@_set_font_dimen:NnN` This function sets the dimension #1 (for font #3) to ‘fontdimen’ #2 for either font dimension 5 (x-height) or 8 (cap-height). If, for some reason, these return an incorrect ‘zero’ value (as `\fontdimen8` might for a .tfm font), then we cheat and measure the height of a glyph. We assume in this case that the font contains either an ‘X’ or an ‘x’.

```

**Hyphenation character** This feature takes one of three arguments: ‘None’,  $\langle\text{glyph}\rangle$ , or  $\langle\text{slot}\rangle$ . If the input isn’t the first, and it’s one character, then it’s the second; otherwise, it’s the third.

LuaTeX decouples hyphenation from font settings, so only `HyphenChar=None` works for that engine.

For other potentially font specific variation axes, there is a raw setter available:

```

```

#### 1.4.3 Font transformations

These are to be specified to apply directly to a font shape:

```

609 \keys_define:nn {fontspec}
610 {
611     FakeSlant .code:n =
612     {
613         \@@_update_featstr:n {slant=#1}
614     },
615     FakeSlant .default:n = {0.2}
616 }
617 \keys_define:nn {fontspec}
618 {
619     FakeStretch .code:n =
620     {

```

```

621         \@@_update_featstr:n {extend=#1}
622     },
623     FakeStretch .default:n = {1.2}
624 }
625 \keys_define:nn {fontspec}
626 {
627     FakeBold .code:n =
628     {
629         \@@_update_featstr:n {embolden=#1}
630     },
631     FakeBold .default:n = {1.5}
632 }

```

These are to be given to a shape that has no real bold/italic to signal that fontspec should automatically create ‘fake’ shapes.

The behaviour is currently that only if both `AutoFakeSlant` and `AutoFakeBold` are specified, the bold italic is also faked.

These features presently *override* real shapes found in the font; in the future I’d like these features to be ignored in this case, instead. (This is just a bit harder to program in the current design of fontspec.)

```

633 \keys_define:nn {fontspec}

650             }
651         }
652     },
653     AutoFakeSlant .default:n = {0.2}
654 }

```

Same but reversed:

```

34 \O@_define_aat_feature:nnnn     {Letters} {InitialCaps} {3} {4}
```

## 1.3 Numbers

These were originally separated into NumberCase and NumberSpacing following AAT, but it makes more sense to combine them.

Both naming conventions are offered to select the number case.

```
35 \@_define_aat_feature_group:n {Numbers}
36 \@_define_aat_feature:nnnn      {Numbers} {Monospaced} {6} {0}
37 \@_define_aat_feature:nnnn      {Numbers} {Proportional} {6} {1}
38 \@_define_aat_feature:nnnn      {Numbers} {Lowercase} {21} {0}
39 \@_define_aat_feature:nnnn      {Numbers} {OldStyle} {21} {0}
40 \@_define_aat_feature:nnnn      {Numbers} {Uppercase} {21} {1}
41 \@_define_aat_feature:nnnn      {Numbers} {Lining} {21} {1}
42 \@_define_aat_feature:nnnn      {Numbers} {SlashedZero} {14} {5}
43 \@_define_aat_feature:nnnn      {Numbers} {NoSlashedZero} {14} {4}
```

## 1.4 Contextuals

```
44 \@_define_aat_feature_group:n {Contextuals}
45 \@_define_aat_feature:nnnn      {Contextuals} {WordInitial} {8} {0}

## fontspec-code-math.dtx

### 1 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever `\setmainfont` and friends was run.

`\fontspec_setup_maths:` Everything here is performed `\AtBeginDocument` in order to overwrite euler's attempt. This means fontspec must be loaded *after* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded.

```
1  \@ifpackageloaded{euler}
2    { \bool_gset_true:N \g_@@_pkg_euler_loaded_bool }
3    { \bool_gset_false:N \g_@@_pkg_euler_loaded_bool }

4  \cs_new:Nn \fontspec_setup_maths:
5  {
6    \ifpackageloaded{euler}
7    {
8      \bool_if:NTF \g_@@_pkg_euler_loaded_bool
9        { \bool_gset_true:N \g_@@_math_euler_bool }
10       { \@@_error:n {euler-too-late} }
11    }
12  }
13  \ifpackageloaded{lucbmath}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
14  \ifpackageloaded{lucidabr}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
15  \ifpackageloaded{lucimatx}{ \bool_gset_true:N \g_@@_math_lucida_bool }{}
```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, `cmr`, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in L<sup>A</sup>T<sub>E</sub>X's operators maths font to still go back to the legacy `cmr` font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the `operators` font, which is generally the main text font. (Actually, there is a `\hat` accent in `EulerFractur`, but it's *ugly*. So I ignore it. Sorry if this causes inconvenience.)

```
16  \DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
17  \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
18  \DeclareMathAccent{\acute}{\mathalpha}{legacymaths}{19}
19  \DeclareMathAccent{\grave}{\mathalpha}{legacymaths}{18}
20  \DeclareMathAccent{\ddot}{\mathalpha}{legacymaths}{127}
21  \DeclareMathAccent{\tilde}{\mathalpha}{legacymaths}{126}
22  \DeclareMathAccent{\bar}{\mathalpha}{legacymaths}{22}
23  \DeclareMathAccent{\breve}{\mathalpha}{legacymaths}{21}
24  \DeclareMathAccent{\check}{\mathalpha}{legacymaths}{20}
25  \DeclareMathAccent{\hat}{\mathalpha}{legacymaths}{94} % too bad, euler
```

```

26 \DeclareMathAccent{\dot}{\mathalpha}{legacymaths}{95}
27 \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}

```

\colon: what's going on? Okay, so : and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```

% % fontmath.ltx:
% \DeclareMathSymbol{\colon}{\mathpunct}{operators}{3A}
% \DeclareMathSymbol{:}{\mathrel}{operators}{3A}
%
% % amsmath.sty:
% \renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript
%   \mkern-\thinmuskip:\mskip6mu plus1mu\relax}
%
% % euler.sty:
% \DeclareMathSymbol{:}{\mathrel}{EulerFraktur}{3A}
%
% % lucbmath.sty:
% \DeclareMathSymbol{@tempb}{\mathpunct}{operators}{58}
% \ifx\colon@tempb
%   \DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
% \fi
% \DeclareMathSymbol{:}{\mathrel}{operators}{58}

```

( $3A_{16} = 58_{10}$ ) So I think, based on this summary, that it is fair to tell fontsop to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```

28 \group_begin:
29   \mathchardef\@tempa="603A \relax
30   \ifx\colon\@tempa
31     \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
32   \fi
33 \group_end:

```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```

34 \bool_if:NF \g_@@_math_euler_bool
35 {
36   \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
37   \DeclareMathSymbol{:}{\mathrel}{legacymaths}{58}
38   \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
39   \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}

```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```

40 \bool_if:NF \g_@@_math_lucida_bool
41 {
42   \DeclareMathSymbol{0}{\mathalpha}{legacymaths}{`0}
43   \DeclareMathSymbol{1}{\mathalpha}{legacymaths}{`1}

```

Finally, we change the font definitions for `\mathrm` and so on. These are defined using the `\g_@@_mathrm_tl(...)` macros, which default to `\rmdefault` but may be specified with the `\setmathrm(...)` commands in the preamble.

Since L<sup>A</sup>T<sub>E</sub>X only generally defines one level of boldness, we omit `\mathbf` in the bold maths series. It can be specified as per usual with `\setboldmathrm`, which stores the appropriate family name in `\g_@@_bfmathrm_tl`.

```

74 \DeclareSymbolFont{operators}\g_fontsencoding_t1\g_@@_mathrm_t1\mddefault\shapedefault

```

(End of definition for `\fontspec_setup_maths`:. This function is documented on page ??.)

`\fontspec_maybe_setup_maths`:

We're a little less sophisticated about not executing the maths setup if various other maths font packages are loaded. This list is based on the wonderful 'L<sup>A</sup>T<sub>E</sub>X Font Catalogue': <http://www.tug.dk/FontCatalogue/mathfonts.html>. I'm sure there are more I've missed. Do the T<sub>E</sub>X Gyre fonts have maths support yet?

Untested: would `\unless\ifnum\Gamma=28672\relax\bool_set_false:N \g_@@_math_bool\fi` be a better test? This needs more cooperation with euler and lucida, I think.

## **1 Closing code**

### **1.1 Finishing up**

Now we just want to set up loading the .cfg file, if it exists.

```

## fontspec-code-xfss.dtx

### 1 Changes/additions to the NFSS

```
\strong \strong {\text}
\strongenv \begin{strongenv} \text \end{strongenv}
```

Typesets text in the 'strong' font. NFSS series equivalent to \emph. Can be nested.

```
\strongfontdeclare \strongfontdeclare {\text}
```

Define the behaviour of nested \strong commands.

```
\strongreset \renewcommand \strongreset {\text}
```

Define the behaviour when a \strong command is nested deeper than the definitions provided by \strongfontdeclare. By default this is \empty — i.e., bold on top of bold remains bold. In certain circumstances it may be appropriate to reset to a default state.

### 2 Implementation

```
1  {*fontspec}
```

#### 2.1 Italic small caps and so on

```
2  \providecommand*\scitdefault{\scdefault\itdefault}
3  \providecommand*\scsldefault{\scdefault\sldefault}
4  \providecommand*\scswdefault{\scdefault\swdefault}
```

LaTeX's 'shape' font axis needs to be overloaded to support italic small caps and slanted small caps. These are the combinations to support:

```
5  \cs_new:Nn \@@_shape_merge:nn { c_@@_shape_#1_#2_tl }
6  \cs_new:Nn \@@_merge_default_shapes:
7  {
8    \tl_const:cn { \@@_shape_merge:nn \shapedefault\scdefault } {\scdefault}
9    \tl_const:cn { \@@_shape_merge:nn \itdefault\scdefault } {\scitdefault}
10   \tl_const:cn { \@@_shape_merge:nn \sldefault\scdefault } {\scsldefault}
11   \tl_const:cn { \@@_shape_merge:nn \swdefault\scdefault } {\scswdefault}
12   \tl_const:cn { \@@_shape_merge:nn \scdefault\itdefault } {\scitdefault}
13   \tl_const:cn { \@@_shape_merge:nn \scdefault\sldefault } {\scsldefault}
14   \tl_const:cn { \@@_shape_merge:nn \scdefault\swdefault } {\scswdefault}
15   \tl_const:cn { \@@_shape_merge:nn \scsldefault\itdefault } {\scitdefault}
16   \tl_const:cn { \@@_shape_merge:nn \scitdefault\sldefault } {\scsldefault}
17   \tl_const:cn { \@@_shape_merge:nn \scitdefault\swdefault } {\scswdefault}
18   \tl_const:cn { \@@_shape_merge:nn \scsldefault\shapedefault } {\scdefault}
19 }
20 \@@_merge_default_shapes:
```

The following is rather specific; it only returns true if the merged shape exists, but more importantly also if the merged shape is defined for the current font.

```

21 \prg_new_conditional:Nnn \@@_if_merge_shape:n {TF}
22 {

31   }
32   \prg_return_true: \prg_return_false:
33 }
34 \cs_set_eq:NN \emfontdeclare \DeclareEmphSequence

```

## 2.2 Strong emphasis

```

(End of definition for `\strongfontdeclare`. This function is documented on page [128](#).)

`\strongenv`

```

51 \DeclareRobustCommand \strongenv

### `\strongreset`

```

73   \cs_set:Npn \strongreset {}

```

(End of definition for `\strongreset`. This function is documented on page [128](#).)

`\reset@font` Ensure nesting resets when necessary:

```

74   \cs_set_protected:Npn \reset@font
75   {
76     \normalfont
77     \int_zero:N \l_@@_strong_int
78   }

```

(End of definition for `\reset@font`.)

## 2.3 Defaults

```

79   \strongfontdeclare{\bfseries}

```

```

80   </fontspec>

```
